In 1956, when John McCarthy held the first academic session on the particular topic, the term artificial intelligence was introduced and made open to the audience as a technological innovation for an enterprise-level transformation. But the path to understanding whether machines can really think in a human way started long before that. Artificial Intelligence or AI can be defined as a machine, robot, or a product and service strategy to determine how people can think and act logically in a given situation. AI is a study of how human brain thinks, learns, decides, and works, when trying to resolve ensuing problems. And eventually, the study of AI has created intelligent software systems. Artificial intelligence carries a goal in mind to improve processes related to human knowledge, such as learning, reasoning and above all, problem-solving. It is a widely accepted and age-old proven truth that the very word viz., intelligence is intangible by nature. It comprises of learning, reasoning, perceiving, problem-solving and of course, assimilates the element of linguistic intelligence. Similarly, the functional realm of artificial intelligence revolves around reasoning, knowledge representation, learning, planning, realizing, processing of natural language and the freedom to move and manipulate objects. The general intelligence sector has long-term

intentions.

In order to apply the damage tolerance design philosophy to design marine structures, accurate prediction of fatigue crack growth under service conditions is required. Now, more and more people have realized that only a fatigue life prediction method based on fatigue crack propagation (FCP) theory has the potential to explain various fatigue phenomena observed. In this book, the issues leading towards the development of a unified fatigue life prediction (UFLP) method based on FCP theory are addressed. Based on the philosophy of the UFLP method,

the current inconsistency between fatigue design and inspection of marine structures could be resolved. This book presents the state-of-the-art and recent advances, including those by the authors, in fatigue studies. It is designed to lead the future directions and to provide a useful tool in many practical applications. It is intended to address to engineers, naval architects, research staff, professionals and graduates engaged in fatigue prevention design and survey of marine structures, in fatigue studies of materials and structures, in experimental laboratory research, in planning the repair and maintenance of existing structures, and in rule development. The book is also an effective educational aid in naval architecture, marine, civil and mechanical engineering. Prof. Weicheng Cui is the Dean of Hadal Science and Technology Research Center of Shanghai Ocean University, China. Dr. Xiaoping Huang is an associate professor of School of Naval Architecture, Ocean and Civil Engineering of Shanghai Jiao Tong University, China.
